Akka Config

Akka Configuration

Akka uses 3 file formats for configuration

- HOCON: superset of JSON, easier to read
- JSON
- Properties

Passing configuration to an ActorSystem

- a plain String (all formats supported)
- application.conf
- a dedicated file

```scala
val separateConfig = ConfigFactory.load("secretDir/secretConfiguration.conf")
val system = ActorSystem(SimpleLoggingActor(), "ConfigDemo", separateConfig)
```

Akka rocks
